INFLUENZA UPDATE

Reports are coming in of the season's first outbreaks of influenza-like disease, from Whitehall (Jefferson County) and Bozeman (Gallatin County). There are no positive viral culture results yet, but several cultures are pending. As always we are interested in reports of outbreaks of influenza-like illness.

EPIDEMIOLOGIC NOTES AND COMMENTS 'THE TICK TELEGRAPH'

INFLUENZA NEWSLETTER

January 19, 1978

Montana

Sentinel physicians are sending more throat swabs for viral isolations, reflecting a widely distributed increase in upper respiratory infections, affecting adults more than children. In the week of January 9-13, eight specimens for influenza virus isolation were received, two from Dr. Vissher's office in Bozeman, one from Dr. McCarthy in Butte, and five from Dr. Swiatek in Ekalaka. In addition two throat swabs were received from student health services at Montana State University, Bozeman. So far none are positive for influenza virus.

Most reporting school systems showed moderate increases in absenteeism for the week of January 9-13. Kalispell and Butte reported their highest values for the season.

A mild outbreak of influenza-like disease appears to be ongoing in the Bozeman area, but school absenteeism has not shown a marked rise.

USA

So far this season nearly 500 influenza A(H₃N₂) viruses have been isolated, with some isolates from all regions. The largest number have been in the middle Atlantic and east north central states. About three-quarters of strains have resembled A/Texas/1/77 and the rest A/Victoria/3/75. There have been no isolations of the new A/USSR/77 strain.

State Lab summary

Specimens submitted week ending:	12/30	1/6	1/13	1/20	1/28	2/4	2/11	2/18
1) for influenza virus isolation	0	1	11	24	43	48	9	10
2) for serologic study for influenza	0	4	7	15	11	20	18	18
3) confirmed positive specimens	0	0	0	0	4	4	2	1

SCHOOL ABSENTEEISM

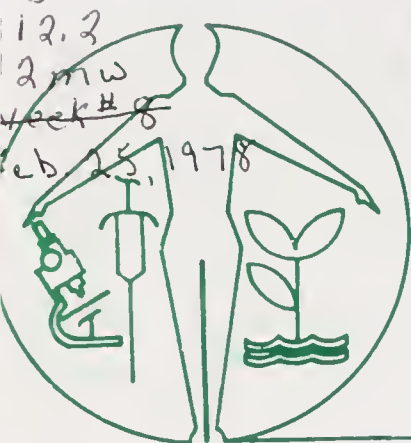

Great Falls	6.8%	Havre	6.6%	Butte	4.2%
Miles City	5.6%	Helena	6.8%	Glasgow	
Kalispell	4.2%	Missoula	3.0%	Bozeman	

Confirmed A/Texas-like influenza isolates have been obtained from specimens from Missoula and Billings. Serologic evidence of A/Texas infection has been obtained from Fort Benton, Manhattan, and Missoula. Influenza A, so far untyped, has been confirmed in Bozeman, Havre, Great Falls, Columbus, Butte, Chester, and Glendive. There has been no confirmed A/USSR activity. Parainfluenza seroconversions have been documented in Bozeman and Butte.

MEASLES ALERT:

Two cases of confirmed measles have been reported from Plentywood. Both were in boys who attended the class B basketball tournament in Butte on March 3, 4, and 5, and who were actively infectious at the time. Several unconfirmed cases have been reported from Richland County.

New cases of measles may well turn up in the towns whose teams also played in the Butte tournament: Big Timber, Circle, Roundup, Three Forks, Lodge Grass, Fairfield, Frenchtown, and Plains. Physicians and nurses should be on the lookout. Please call 1-800-332-22 to report cases; weekends and nights, call 449-2645.

INFLUENZA

Seroconversions to A/Texas and A/Victoria (H₃N₂) influenza viruses continue to occur in patients from all around the state. No seroconversions or viral isolation of A/USSR(H₁N₁) have been identified. Reported school absenteeism remains unremarkable.

3. confirmed positive specimens	4	4	2	1	21	18	5	10

MEASLES CONTINUES:

20 or more cases of measles, one confirmed serologically, have occurred in the Sidney-Fairview area. Cases are still occurring. No cases have been reported from elsewhere in the state, but junior bands from schools in Savage, Richey, Circle, Glendive, Wibaux, and Baker visited Sidney 3/18, while many active cases were occurring, putting susceptible children at risk of measles.

MEASLES

A single case of measles has been reported in a student at Montana State University. A related case was reported from Sweet Grass County. An apparently unrelated case has been reported in a 21-year-old Ravalli County woman. (These cases underscore the changing epidemiology of measles, which is attacking teenagers and young adults, a very mobile population, much more than in the past.)

In an opinion solicited several months ago, the State Attorney General has stated that the Health Department's quarantine power may properly be used to limit attendance at schools where measles transmission is occurring to students with proof of natural immunity or immunization. This power has not yet been used in Montana, but is available as a tool to contain measles outbreaks when more traditional methods are failing.

EPIDEMIOLOGIC NOTES AND COMMENTS 'THE TICK TELEGRAPH'

To: All Health Officers
From: Martin D. Skinner, M.D., State Epidemiologist
Subject: Rocky Mountain Spotted Fever Vaccine

We have received numerous inquiries over the past weeks, concerning the availability (or lack thereof) of RMSF vaccine.

This Vaccine is no longer manufactured in The United States, and is unavailable because of doubtful efficacy.

Immunization with this Vaccine - even when followed by booster doses - does not necessarily protect an individual against acquiring RMSF. Persons with known high post-vaccination titers have acquired the disease.

New vaccines are being developed but are not yet available.

RMSF is very uncommon in Montana in recent years. A daily total-body examination for ticks, when trespassing in tick infested areas, is highly recommended for all persons. This will protect against other tick-associated diseases, such as Colorado tick fever and tick paralysis, as well.

Persons requesting RMSF vaccine should be told of its unavailability and encouraged to pursue these other means to prevent tick-associated diseases.

If you have further or specific questions, please call me or Dr. Hopkins at (406) 449-2645.

INFLUENZA UPDATE

Although influenza activity appears to have tapered off, a few interesting late reports have come in.

In addition to three probable seroconversions to A/USSR/90/77, CDC had confirmed two definite seroconversions to A/USSR. One was in a 19-year-old woman from Havre with onset of disease 3/4/78, and one in a 22-year-old man from Missoula with onset 2/14/78.

An influenza A isolate from Billings, isolated from a swab sent in 2/7/78 by Dr. Baltrusch, has turned out to be a new variant of H₃N₂ virus, similar to A/Victoria and A/Texas but different enough to be called A/Montana/2/78.

SHIGELLOSIS

An outbreak of diarrheal illness caused by Shigella sonnei has been underway in Glendive for 3 to 4 weeks. Infection was originally spread through a day-care center, but subsequently has spread through families, with a high attack rate (over 50%) of clinical disease in household members of cases. About a dozen cases are culture-confirmed; the total number of cases so far can be estimated to be between 50 and 100.

The clinical syndrome is one of sudden onset of headache, fever, and prostration, with diarrhea, commonly blood-tinged, following in a few hours and lasting 2 to 6 days.

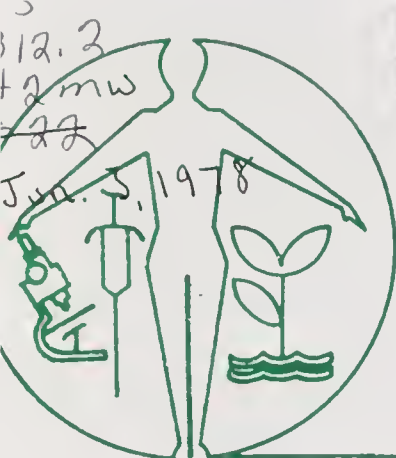

Necessary control measures include:

1. Education of family members about proper hand-washing to minimize spread within households
2. Culture of symptomatic family contacts.
3. Exclusion from work of food-service, child-care, nursing home, & hospital workers with shigellosis until a full course of antibiotic treatment has been completed and a negative stool culture has been obtained off antibiotics.

The isolates from Glendive have all been resistant to sulfa drugs & tetracycline and sensitive to ampicillin, chloramphenicol, and cephalosporins.

EPIDEMIOLOGIC NOTES AND COMMENTS 'THE TICK TELEGRAPH'

June 27, 1978

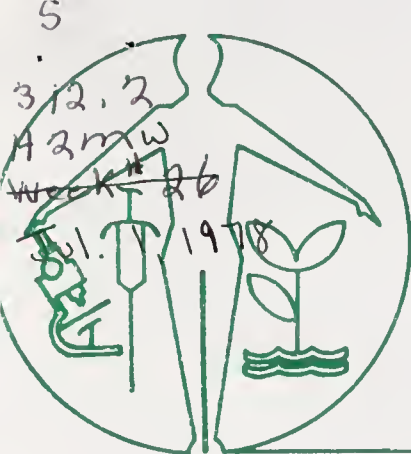

DENGUE IN PUERTO RICO

Dengue is a viral disease transmitted by mosquitoes and is characterized by sudden onset, high fever, severe headache, joint and muscle pains, and sometimes rash. The rash appears 3-4 days after onset of fever and may spread from the torso to the arms, legs, and face. The disease is usually mild and many cases of sub-clinical infection occur; occasionally, however, recovery may be prolonged for a week or more.

An outbreak of dengue is presently widespread in Puerto Rico. Intensive spraying with insecticides and reduction of breeding sites in San Juan and other areas has been undertaken by Puerto Rico Department of Health.

In spite of the fact that the risk of dengue infection appears to be small, TRAVELERS TO PUERTO RICO SHOULD TAKE PRECAUTIONS TO AVOID MOSQUITO BITES. The vector mosquito, Aedes aegypti, is active in the daytime and is most frequently found near human habitations where it breeds in small containers of water such as discarded tires, vases, and barrels. Few mosquitoes will be found in areas where careful housekeeping and sanitation have eliminated such breeding containers. The risk of bites may be reduced by use of commercially available insect repellents and by protective clothing such as long-sleeved shirts and pants. There is no licensed vaccine against dengue. Travelers should advise their physician of any acute febrile illness occurring within 2 weeks after leaving Puerto Rico. Physicians should notify their state health department of any person with suspected dengue.

EPIDEMIOLOGIC NOTES AND COMMENTS 'THE TICK TELEGRAPH'

July 5, 1978

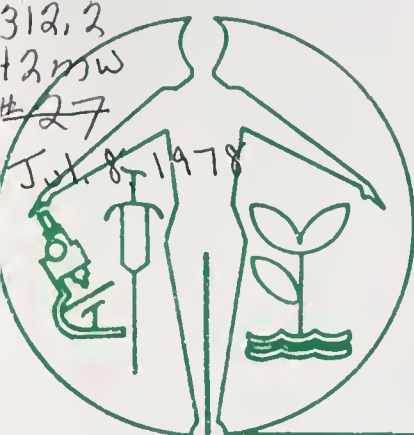

Subject: Poliomyelitis in the Netherlands

As of June 23, 1978, 38 confirmed and 15 suspect cases of type 1 poliomyelitis have been reported from 5 of 11 provinces in the Netherlands, all in a population that rejects vaccination on religious grounds. The affected provinces include South Holland, Utrecht, Gelderland, Zeeland, Overijssel. The popular tourist city of Amsterdam has not been affected.

Although there is no evidence of spread of the disease beyond the religious community, the health authorities in the Netherlands are recommending prompt vaccination for all residents under 27 years of age with incomplete vaccination histories. In spite of the apparently very small risk of acquiring poliomyelitis in the Netherlands, the polio immunity of travelers to the Netherlands should be evaluated and those with inadequate protection should complete their primary vaccination.

Anyone who has completed the primary trivalent oral poliovirus vaccine (TOPV) series in the past and who plans to travel extensively in the affected areas within the Netherlands should be given a single additional dose of TOPV. The actual need for this supplementary dose has not been established, but there is value in assuring protection against infection with wild poliovirus when exposure can reasonably be expected.

OTHER REPORTABLE DISEASES:

TYPHOID FEVER - 1, Rosebud County

TYPHOID

Montana's first typhoid case in 2 years has been reported from Rosebud County, and the stool culture confirmed as *Salmonella typhi*. The patient is being treated in the hospital and an epidemiologic investigation is underway.

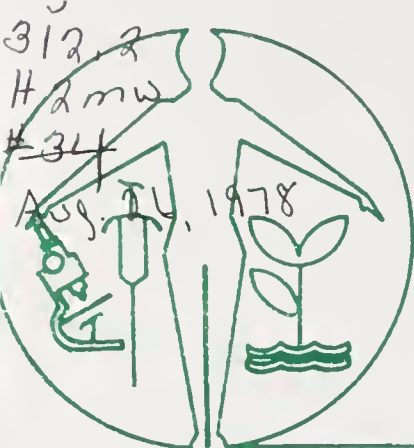

ASEPTIC MENINGITIS

The month of August has seen an upsurge in reported aseptic meningitis cases, with 14 cases reported, at least one each from Beaverhead, Blaine, Custer, Gallatin, Hill, Lewis & Clark, Sheridan, Silver Bow, & Yellowstone Counties. ECHO virus isolates have been made from two cases, and identification is pending on two more. The syndrome is typified by headache, low fever, stiff neck, and mild CSF lymphocytosis. (There have been no human cases of Western Equine Encephalitis and only one confirmed horse case.)

OTHER REPORTABLE DISEASES: 1 - TYPHOID FEVER, Yellowstone County

The first case of Legionnaires' Disease in a resident of Montana has been confirmed in a 33-year-old Great Falls man. The illness was in early June. The diagnosis was confirmed by serologies performed in the State Laboratory (which now has the capability to do the necessary tests) and the Center for Disease Control. The source of his illness is not clear but may well be out of state.

More details will be in a special mailing.

Cases of diarrheal illness caused by *Shigella sonnei* continue to occur at an increased rate across much of the state. In recent weeks cases have been reported from Dawson, Fergus Hill, Yellowstone, Roosevelt, and Valley counties. Most of these cases are caused by the same motile biotype that caused the recent outbreak in Valley and Roosevelt counties.

Recommended control measures include education of cases about personal hygiene, prompt adequate treatment of cases, and search for undiagnosed cases (especially in food-handlers, child-care workers, and nursing home workers).

MEASLES BULLETIN

Over 60 cases of measles have been reported from the Spokane, Washington area. Although control measures are being taken in Spokane, physicians in Western Montana should be particularly alert for cases of measles, especially in children and teenagers who have been in contact with persons from Spokane.

1-800-332-2288 is still the number to call with measles case reports.

INFLUENZA REPORT #1

Although influenza caused by the A/USSR strain has been reported in Texas, there has been little or no influenza activity reported in Montana. The State Laboratory has received small numbers of paired sera for viral diagnosis of respiratory illness, but none have proved to be diagnostic of influenza. School absenteeism in 12 communities remains low (we expect over 10%, and up to 40%, absent in a true influenza outbreak), and emergency room visits for influenza-like illness remain near base-line in Great Falls, Missoula, and Billings.

INFLUENZA BULLETIN

School absentee figures for Montana continue to show no abnormal rise. Secondary schools in eastern Idaho (Idaho Falls, Rexburg) have reported absenteeism up to 50% and this is thought to be related to A/USSR outbreaks in the Salt Lake City area.

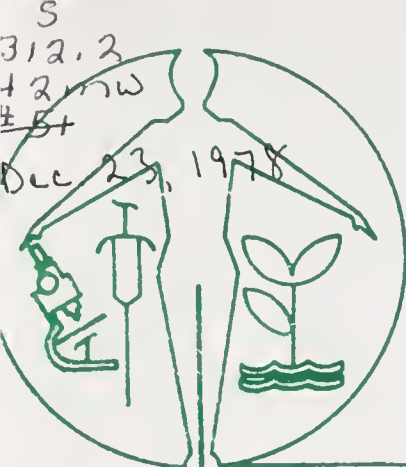

SCHOOL ABSENTEES:	12/5		12/5
Billings Central	4.7%	Helena	6.0%
Bozeman	5.2%	Kalispell	4.8%
Butte	5.8%	Laurel	6.5%
Glasgow	5.4%	Lockwood	4.9%
Great Falls	5.2%	Miles City	5.0%

OTHER REPORTABLE DISEASES: Emergency Room visits for influenza like disease

WEEK ENDING:	Deaconess Great Falls			St Patrick's Missoula			St Vincent's Billings		
	Flu-like Illness	Total Visits	% Illness	Flu-like Illness	Total Visits	% Illness	Flu-like Illness	Total Visits	% Illness
11/13	50	259	19.4	4	274	1.5	46	728	6.3
11/20	23	206	11.2	6	262	2.3	33	427	7.7
11/27	22	269	8.2	11	274	4.0	19	757	2.5
12/04	28	240	11.7	17	255	6.7	35	540	6.5
12/11	23	212	10.8	25	235	10.6	36	462	7.8
12/18	28	246	11.7	6	304	2.0	43	595	7.2
12/25	35	304	11.5				57	636	9.0

It is misleading to compare figures from one hospital to the rest, because of different diagnostic habits; but trends within one emergency room should be useful.
